BasiliskAI Marketing Content

Minimal. Open source.
BasiliskAI makes AI a first-class citizen in your coding environment — not a clunky afterthought.

Your design isn't just seen — it's felt. From landing pages to dashboards, you describe your vision in plain language and Basilisk instantly spins up a functional, interactive app. Product managers, marketers, stakeholders — anyone — can turn ideas into working interfaces. No more dev handoffs, context loss, or "this doesn't look like the mock." You shape interactions in real time.

————

Core Features

1. The AI knows your codebase.

Basilisk indexes your entire repo — folder structure, imports, dependencies, quirks and all. Say "Add a dark mode toggle" and it updates every relevant file, keeping the system in sync.

2. Edits like a real teammate.

Select code, hit Cmd+K, say what you want. Basilisk rewrites inline, preserving formatting, comments, and style. You review the diff, approve, done. No copy-paste. No formatting purgatory.

3. Works at scale.

Multi-file reasoning means a one-hour refactor across 15 files becomes one AI command. Imports, types, and naming stay consistent everywhere.

4. Flow stays unbroken.

Basilisk lives inside your IDE and your command palette. It's as native as "Find and Replace" or "Git Commit." No browser tabs, no context switching.

5. You ship faster, with full control.

Every change is a diff you can inspect. Full Git history. Easy reverts. AI speed, human judgment.

——

If VS Code is a workshop, Basilisk is the expert apprentice who's read your whole codebase, knows your tech stack, and works at the speed of thought.

——

The UX hard-sell:

Basilisk is the closest thing to Figma for live apps.
You're not mocking experiences — you're delivering them. The gap between concept and code disappears.

——

🚀 Instant reality check
Wireframes lie. In Basilisk, your idea is a real app the same day you sketch it. No "handoff" — just a URL.

🤝 Design jam sessions
Everyone's in the file, watching the product evolve live — colors, layouts, logic — as you talk. You're all building together.

🔁 User testing without lag
Testers use a real interface, not a clickable illusion. You see exactly how it behaves under real human chaos — and can ship fixes before they leave the room.

⚒ The dev environment disappears
No Git merges, Node versions, or server setup. You shape products like you shape layouts in Figma or Miro.

⚡ Practical AI

"Make the nav sticky and animate the dropdown" — done, live. Not a snippet, not a suggestion — a real change in the running app.

———

Bottom line:

Basilisk turns UX work from blueprints into buildings. Your team feels the real thing early enough to fix what matters — before it's baked into release.
